

NimmaGuruApp - Project Report

1. Introduction

NimmaGuruApp is an Android application developed to bridge the gap between learners and educators. The main aim is to provide a simple platform where educational content and guidance can be shared efficiently. The project is built using Android Studio and managed using Git and GitHub.

2. Objective of the Project

- To create an Android-based learning support application.
- To connect educational resources in a structured way.
- To implement real-world software development using Git and GitHub.
- To understand version control and project deployment workflow.

3. Tools & Technologies Used

Android Studio, Kotlin/Java, XML, Git, GitHub.

4. Project Setup Process

Git initialization, adding files using `git add .`, committing changes, connecting GitHub repository using remote origin, and pushing code to GitHub.

5. Project Structure

app/ - Main application code. src/ - Source files. build.gradle.kts - Build configuration. settings.gradle.kts - Project settings.

6. Features of the Application

Android UI design, modular structure, version control integration, GitHub hosting, structured Gradle setup.

7. Learning Outcomes

Git and GitHub workflow, Android project structure, version control usage, debugging command-line errors, repository management.

8. Challenges Faced

Git Bash command errors, authentication issues, remote repository setup problems, file path confusion, empty commit issues.

9. Conclusion

The NimmaGuruApp project demonstrates Android development integrated with Git and GitHub. It improved practical skills in version control and project deployment.
